Technology Modernization - Focus on reusability and reduction in data replication

Description

1. Adopt and contribute to the development practices to build the common reusable framework and implement enterprise capabilities (NRT and Spark/Scala)
2. Build reusable/configurable components as priority
3. Align to strategic solution where possible, work with architect on design which is reusable
4. Minimize data replication as part of solution

Comments

HBase implementation into Data Consumer Framework, Upgraded Data Consumer framework to unexpected mapr upgrades and co-ordinated across teams. Build reusable/configurable components. Designed and developed GPS, Care Service Connect, CHF incremental , GLX incremental, SMART incremental,CDID incremental, NAVI CDB population. Minimize data replication as part of solution by implementing purge on new developments and removing unused data.

1. Contributed to HBase development for Spark Scala based Data Consumer Framework. Updated Framework to compatible enterprise version upgrades occurred as part of migration and coordinated same across dependent teams using this framework.
2. All scripts developed are configurable.
3. Provided solution for designing HouseCalls connect ,Orchestration, Care Services to reduce dependency on files. Provided solution for TTS issues by guiding team in modifying design and implement capabilities to improve performance. Provided solution for incremental process for HouseCalls and developed code for CHF, GLX and SMART . This process were highly impacting HouseCalls Business in utilizing full refresh on daily. With changes to incremental has made their process to run smoothly.

Business Goals

4. As part of Care service Connect , TTS and HouseCalls solution data replication was taken care by purging data for every-load.

Title	Goal Category: Fundamental Execution	1	2	3	4	5	N/A
Improve engineering discipline and delivery quality by adopting development standards provided/mandated by Enterprise and Enterprise Development community							
Description							
1. Adopt and utilize CI /Jenkins pipelines including automation of code build, deployment, unit testing, system testing & compliance 2. All deployments must have Sonar Code Quality above gate 8 for Spark/Scala code 3. All NRT project deployment must have Sonar Code Quality gate 10 (Near Real Time this refers to streaming capabilities like Spark/Kafka) 4. Work towards goal of 'One Click' deployment in all environments with unit, system and integration testing Ensure engineering discipline by 1. Effective code reviews, code management processes, design and testing best practices 2. Adopt open source coding and development practices wherever appropriate 3. Be able to effectively demo features or user story acceptance criteria to PO 4. Manage knowledge artifacts using Wiki							
Comments							
Jenkins automation is used as standard practice in deployments for Care Services. Sonar implementation is performed to check Data Framework code quality. Code reviews are provided to team before proceeding to QA. Versioning is maintained in GIT repository as code management process. Python automation is utilized for testing. Open source tools like Bash scripting, Python, Scala and Airflow are utilized in all new developments and automation. Demos are part of team culture to get approved by PO. Updated Wiki with new Airflow environmental details and run book for Python automation framework.							

Title	Goal Category: Fundamental Execution	1	2	3	4	5	N/A
Improve production stability and availability as per SLA							
Description							
1. Establish DevOps model by fully integrating operational activities within the scrum teams 2. Support (as requested by Ops Lead) reporting operational metrics on a regular basis to management including SLA missed by month per product 3. Reduce manual operational activities through automation, refactoring, and decommissioning 4. Assist team with capacity management through formal capacity planning and storage management by adopting purge and capacity management process 5. Ensure no stories/features are deployed in production without verification of Acceptance Criteria							
Comments							
Most of the SLA's are met for CCM and HouseCalls. Reduced incident ticket. Automated incident ticket created for job failures and auto-restart ability with Airflow.

Business Goals

No stories are deployed without verification of Acceptance Criteria.

1. Establishing DevOps model by taking care of operations and development. Contributing to improving performance and performing code fixes to existing defects.
2. Any impacted SLA's are reported immediately to business, through standard communication process.
3. Reduced manual operational activities using Airflow process which has inbuilt restart ability and utilizing scripts to create incident tickets. Refactoring code for defect fixes and better performance.
- Contributing to Team flash in decommissioning Talend integration tool and developing HouseCalls and CCM jobs in Airflow open source integration tool.
- 4.Purging of unused CDID is performed to reduce processing of unused data.
5. RCA automation process is implemented to ensure no stories/features are deployed in production without verification of Acceptance Criteria.

Shilpa does great with her scrum team activities - completing tasks on time & delivering great quality product for the customer. She has also done a great job supporting the operations team through the year & on multiple occasions her understanding of the job at hand has help the team meet SLAs while solving the issue at hand.

Shilpa's ability to communicate with her team & business has evolved over the course of the year and she is getting more comfortable expressing her opinions and sharing her findings & knowledge with the team.
I would urge her to continue working on her ability to lay out her agenda with confidence & learn to hone in on her communication skills with leaders outside of her scrum team.
